HUMAN RESOURCES INFORMATION INTERNET ACCESSIBLE DATABASE

ABSTRACT OF THE DISCLOSURE

A database of subscriber data includes employee data for a plurality of employees and is correlated to a plurality of employee attributes. A query from a specific subscriber includes at least one desired employee attribute. A report is compiled from the database in response to the query that provides associated employee data for employees that have the at least one employee attribute. In a preferred embodiment, the report is electronically provided to the specific subscriber via an HTML form. In another embodiment, each query is associated with a specific subscriber and stored. When the specific subscriber later selects the stored query, an updated report is provided such that the specific subscriber is not required to again enter the at least one desired employee attribute associated with the stored query.
